Field of the Invention The present invention relates to a wireless network communication system and, more particularly, to a method and apparatus for effectively managing unicast data communication services in a wireless communication network. 2. Description of the Related Art The wireless communication network system such as the next generation communication system has developed at a very high speed, and requires an effective method for effectively using limited frequency resources in a wireless network. However, wireless communication standards have not proposed or specified an effective method for efficiently communicating unicast or broadcast data without interfering with other communication networks. The unicast data is data that is not destined to be directed to a plurality of a destination user equipments within a common base station or macro base station, but is destined to one user equipment. For example, traffic on a unicast basis is, in particular, data destined to a particular user equipment within a specific communication base station, in contrast to traffic on a broadcast or multicast basis. As described above, in a wireless network, a method of managing unicast data of wireless communication network has been not commonly defined. Accordingly, there is a need for a method for

effectively managing unicast data of a wireless communication network. Also, there is a need for a method of efficiently transmitting unicast data by minimizing the interference of the data transmission to other data transmission in communication between a base station and the user equipment. The above references are incorporated by reference herein where appropriate for appropriate teachings of additional or alternative details, features and/or technical background. Q: Is there a way to change the action in a UITableViewCell to something like an ImagePicker? There are several apps like Instapaper where you tap on a cell and it shows you the image from the feed displayed by the app, is there a way to create a custom action on a table view cell that would do something similar? A: You have 2 options to achieve this: The first one is to use an UITableViewDelegate extension to get the image selected by the user: extension UITableViewDelegate { func tableView(_ tableView: UITableView, didSelectRowAt indexPath: IndexPath) { print("cell tapped: f678ea9f9e
